Baran Nazari

Senior Frontend Engineer

Munich, Germany | +491782741540 | baran.f.nazari@gmail.com

Six years production TypeScript and JavaScript experience, three of them inside a significantly large TypeScript SaaS platform built on a custom OOP JavaScript framework with its own lifecycle methods, route-based state management, and in-memory value diffing. Platform-level thinking: module contracts, extension points, interfaces designed to hide complexity while exposing the right primitives. React with Redux / Redux Toolkit in production at two earlier companies. Real-time systems (WebSockets, WebRTC, Web Workers) as production infrastructure. Previously a product manager. AI coding tools daily, human-in-the-loop. Available immediately. English C1; German B2.

PROFESSIONAL EXPERIENCE

Frontend Engineer | sqanit GmbH, Munich (SaaS platform for product life cycle and DPP) *Oct 2022 – Feb 2026*

- Built and evolved a significantly large TypeScript enterprise SaaS platform — including two product shells, a backoffice console and a mobile-facing view, in the same codebase — on a custom in-house OOP JavaScript framework, class-based with an architecture very similar to its backend's, complete with its own lifecycle methods, route-based state management, and in-memory value diffing — the same machinery React is built on, just exposed rather than abstracted. Living inside that machinery is where platform depth comes from.
- Worked with a singleton service layer of root and child classes that mapped services to endpoints — with DTOs, mappers, and dependency injection — and the same architecture and lifecycle everywhere, so consumers learned each contract once and used it everywhere. Updates were versioned and usually backward compatible, with rare major versions that broke compatibility.
- Worked closely with backend engineers to set API contracts and design integrations — error handling, bugs in services, edge cases across the data flow, and API testing. Interested in taking on more of that side of the work.
- Worked in a highly modularized codebase — MVC structured, with a service locator wiring dependencies — where modules connected through deliberately designed interfaces, hiding implementation complexity while exposing the primitives product features actually needed. Building on shared foundations, and improving those foundations without breaking the code above them, was daily work.
- Wrote components together with their tests, so other engineers, and I myself later, could reuse them.
- Designed extension points for complex entity-creation flows — pluggable steps, contract-driven state transitions — so new product surfaces could be composed without touching core paths.
- Wrote unit, component, and end-to-end tests: raised test coverage ~15% by identifying hidden edge cases that weren't being caught and building Playwright test infrastructure around them, with end-to-end tests also serving as measurements of API health status.
- Refactored, modularized, and reduced tech debt as first-class work — including a codebase-wide refactor from prototypes to classes, carried out while features and customer requirements kept shipping.
- Designed complex state-management systems from first principles — URL as source of truth, browser storage for persistence, custom sync patterns for reliability in event-driven, data-heavy views. State lived in a central component that called services in its lifecycle and then imported the mapped views.
- Contributed to architectural decisions through clear proposals and cross-team discussions; shaped module boundaries and interface contracts; mentored peers through code review, pairing, and knowledge sharing.
- Measured, profiled, and improved rendering performance in a data-heavy interface using browser DevTools and targeted instrumentation — performance as a running concern, not a project.
- Used Web Workers, WebRTC, WebSockets, push events, and IndexedDB in production: real-time data sync, multi-channel orchestration for compatible and stable state under load, client-side storage, and background processing as everyday tools.
- Used Git workflows across multiple product environments — branching strategies, code review processes, release management.

Frontend Developer | Smartech, Tehran (Martech platform) *May 2021 – Sept 2022*

- Worked closely with backend engineers on API contract design and integration — REST endpoints, error handling, and edge cases across the data flow.
- Built and shipped key features for a production React/Redux AdTech/MarTech campaign-runner platform used by major e-commerce vendors — owned delivery end-to-end from requirements through production, in a real-scale SaaS environment.

- Migrated state management from Redux-Saga to Redux Toolkit at project start — a deliberate architectural call that reduced codebase size ~5%, cleaned up async patterns, and set the team up with the current-standard React ecosystem toolkit.
- Implemented state-persistence strategies with browser storage, URL and Redux middleware to keep the user experience intact through reloads and network instability.

Frontend Developer | Rahnema Co., Tehran (OKR tracking platform) *Apr 2020 – Apr 2021*

- Delivered features for a complex OKR-tracking React application using Redux and AmCharts — data-dense interactive dashboards.
- Restructured legacy code and folder architecture; cut bundle size ~15% by removing redundant libraries and standardizing the UI layer.

Freelance Frontend Developer | Tehran *Jul 2019 – Mar 2020*

- Deliberate, self-directed career transition into software engineering — built JavaScript, TypeScript, and React from scratch, contributed to open-source, shipped production-standard work independently.

Software Product Manager | Fanap Plus, Tehran *Jul 2018 – Sept 2019*

- Shaped the roadmap for a sports-ranking platform; shifted the team from Scrum to Kanban, improving delivery velocity by ~15%. The product background feeds directly into how I approach platform decisions today — systems thinking about tradeoffs and long-term maintainability isn't something I switched on when I moved into engineering.

Software Product Expert | NOZHA, Tehran *Jul 2015 – Jun 2018*

- Coordinated across development, animation, and UX teams to ship a mobile quiz game two months ahead of schedule.

AREAS OF EXPERTISE

Core: TypeScript, JavaScript (ES6+) — deep language knowledge, comfortable in large evolving codebases; basic Python

APIs & Data: REST, GraphQL, real-time sync, streaming endpoints, API contract discussions, backward compatibility

Platform Patterns: Plugin systems, extension points, module interfaces, developer experience utilities, modularization at scale

Architecture & Patterns: OOP, functional programming, design patterns, DTOs and mappers, dependency injection, platform contracts, versioning and backward-compatible updates, tech debt reduction

Testing: Playwright, Cypress, Vitest — unit, component, E2E; test infrastructure design; edge-case hunting

Frontend Frameworks: React, Next.js, Redux / Redux Toolkit — custom-framework background means new component systems adapt fast

Tooling & Runtime: Vite, Node.js, GitLab CI/CD, Docker, Git, Linux

Security & Auth: JWT, token management, session patterns, XSS protection, CORS, input handling

State Architecture: URL-first state design, browser storage persistence, caching & sync strategies, event-driven data flows

Real-time Systems: WebSockets, push notifications, WebRTC, multi-channel orchestration for conflict-free / compatible state updates

Browser Platform: Web Workers, IndexedDB, browser rendering pipeline, native APIs as infrastructure

Performance: Measurement, profiling, rendering optimization, bundle size, list virtualization, cross-browser behavior

Observability: Browser DevTools, targeted logging, debugging across the network boundary, rollout awareness

Collaboration: Cross-functional work, code review, pairing, mentoring, RFC-style proposals

AI Workflow: Claude Code, Codex — human-in-the-loop: humans define specs, AI delivers, output always audited

Languages: English C1, German B2

EDUCATION

MSc Civil Engineering · Sharif University of Technology, Tehran

Senior Frontend Engineer

For three years in Germany I worked at sqanit on a SaaS platform for product life cycle and DPP: a small team, big product and high velocity. The platform ran on an in-house MVC framework, and I covered everything from implementing features to writing the tests.

Before that I worked with React and Redux, and I tend to think in frameworks: how lifecycle, state and components fit together. All the products I've built as an engineer have been B2B.

I spent about four years in product roles before engineering, so I'm comfortable in multidisciplinary teams. I taught myself JavaScript, TypeScript and React, and I'm eager to learn new concepts.

I'm interested in TypeScript, frontend architecture and platform roles, and in work that goes deeper into AI, which I already use daily as a coding tool. I'd like to hear what your teams are building and where my background fits. I'm based in Munich and available immediately; my German is B2 and my English C1.
